HASHAM JAVED

"ZUDIO" // CYBERSECURITY STUDENT & OFFENSIVE SECURITY ENTHUSIAST

Gujranwala, Pakistan | Open to relocation | zudio001@proton.me | github.com/zudio-infosec | linkedin.com/in/hasham-javed | zudio-infosec.github.io | TryHackMe: zudio.infosec

PROFILE

Self-taught cybersecurity student (since 2023) focused on offensive security and red teaming. Builds Python security tooling, solves CTF challenges across web, crypto, Android reverse engineering and DFIR, and publishes authorized writeups documenting the process. Comfortable working independently in an isolated lab environment and picking up new tools quickly. Looking for an entry-level/internship role to apply these skills in a real team setting.

TECHNICAL SKILLS

- **Languages:** Python, C++, Bash
- **Security Tools:** Nmap, Burp Suite, Metasploit, Wireshark, ExifTool, jadx-gui (Android reversing)
- **Environment:** Kali Linux, isolated VirtualBox lab (Windows 7/10/11 guests) for malware-behaviour and OS security testing
- **Domains:** OSINT, web application recon & exploitation (SQLi, IDOR, XSS, auth bypass), Android app reverse engineering, digital forensics & incident response (DFIR), network/cryptography CTF challenges

PROJECTS

Zudio Recon Framework
Python — github.com/zudio-infosec/zudio-recon-framework

- Multi-threaded offensive reconnaissance tool wrapping nmap, whois, amass, dig, curl and nikto into one modular pipeline
- Includes an auto-installer for dependencies and an automated report generator for scan results

CTF Writeups
github.com/zudio-infosec/ctf-writeups

- Public, learn-in-public collection of solved CTF challenges (PicoCTF, TryHackMe, hackathon workshops) with full methodology and thought process documented

Personal Portfolio
zudio-infosec.github.io

- Self-built site showcasing projects, writeups and live platform progress (TryHackMe, PortSwigger, HackTheBox)

CTF & HANDS-ON EXPERIENCE

Cybersecurity Hackathon 2026 — *GIFT University, Gujranwala*

- 3-day, beginner-to-intermediate workshop covering web, mobile, network, crypto and DFIR; solved 11 challenges spanning Android native-library reversing, firmware nonce-reuse crypto, session forgery, reflected XSS, sequential/parameter-based IDOR, and a simulated APT (SideWinder) DFIR scenario

TryHackMe & HackTheBox — *ongoing*

- Rooted HTB "Cap" via an IDOR on a packet-capture endpoint chained with a Linux capability misconfiguration (cap_setuid on python3.8)
- Completed TryHackMe OhSINT (image metadata → full OSINT trail via ExifTool) and multiple guided web/infrastructure pentest rooms

PortSwigger Web Security Academy — *in progress*

- Working through the SQL Injection learning path (labs 1–5 completed)

CydeaRange CTF Platform

- Solved "Cache Bloom" (multi-tenant cache-key collision) and "Shift In Sands" (DFIR reconstruction of a simulated APT exfiltration chain)

CERTIFICATIONS — IN PROGRESS

- Working toward: eJPT → CEH

EDUCATION

Intermediate (ICS) — Computer Science, Mathematics, Physics
